

## Make-your-Own Succulent Potting Mix

Mix:

1 part volcanic pumice or coarse/sharp sand (such as construction or granite sand)

2 parts quality potting mix (first ingredient should be decomposed wood/bark or coir, not peat moss\*)

Optional:

½ part well-made compost or ¼ part worm castings

\*When peat moss dries out, it sheds water and is very difficult to rehydrate. Succulents usually do best when allowed to dry out between waterings.
